

## GRASSPROTECTA

### ALLEYWAYS

Montreal, QC

**GrassProtecta** is a heavy duty thick polyethylene mesh for reinforcing grassed surfaces prone to wear, rutting and smearing. The oscillated mesh structure has been designed to increase traction and improve slip resistance by up to 97% compared to standard straight oriented meshes.

A few years ago, the city of Montreal started a project to make some of alleyways behind residents' homes safer and more aesthetically pleasing. The alleyway needed to be leveled and concrete pavers put in along with GrassProtecta. The area was then seeded with clover and grass. The alleyway was closed to circulation for approximately five weeks in order to allow the vegetation to grow.

Additional information regarding GrassProtecta can be found on our [website](#).

*All TYPAR grass and ground reinforcement products are suitable for use as a source control solutions in LID and NPDES applications.*
