

Keeping a garden weed free requires constant maintenance. Many hours can be spent throughout the spring and summer keeping your garden free of weeds.

Landscaping contractors suggest using Biobarrier

No more back breaking work weeding the garden. Biobarrier is the only solution for long term root and weed control.

See how easy it is to create a weed free rock garden with Biobarrier.

*Clean out and prepare the garden.*

*Unroll the Biobarrier membrane and surround the tree/shrub as shown.*

*Place stones at random.*

*Cover Biobarrier with 2" to 3" of soil.*

Repeat until you have covered the entire garden. Place flower pots in the desired location.

In the desired location, clear the soil and expose the Biobarrier membrane. Make an incision in the membrane, remove plant from pot, and plant in the ground (below the membrane). Surround the plant with soil and ensure that the exposed membrane is also covered with soil (2" - 3")

Repeat same process until all plants have been planted.

**Completed.**  
Enjoy those hours that would have been spent weeding!

Biobarrier's performance is guaranteed by the manufacturer for 15 years, but you can expect it to last for 25 and even 30 years!
